In this master's thesis, Geography and Architecture: Interdependence and Some Issues of Landscape Architecture On the example of Tbilisi, some preconditions of the interdependence of geography and architecture, scientific methodological sources and historical-geographical features are discussed. The laws of harmony of nature and the basic concepts of the beauty of the surrounding world are presented. An analysis of the existing landscape-architectural assessment of some areas of Tbilisi is given. Landscape-architectural and aesthetic assessment of Vere valley has been made.

The thesis is based on literary and cartographic sources and analyzes of materials collected as a results of research. The thesis actually reflects the current state of the issues raised in the master's degree.

Given the current situation, I consider the most important task to be solving the problems of aesthetics, design, and projecting the landscape architecture from a modern point of view at the state level. I welcome the Landscape Architecture course in the undergraduate program of the Department of Geography: Inserting aesthetics, design and projecting, and continuing to work in this area.

I believe that there are no unresolved problems, it is necessary to actually identify the problems, study them and take the right measures. This thesis offers my view of ways to solve existing problems.
